Concepts

•	Independence, dependence, and exclusivity describe the relationship between events (two or more events), and they have different mathematical meanings:
•	If two events are exhaustive , it means they make up the whole sample space .
•	The law of total probability can be expressed mathematically as:
•	The law of total probability is often written using the summation sign :
•	For any events A and B, we can use Bayes' theorem to calculate P(A B):
•	P(A B) is the posterior probability of A <i>after</i> B happens ("posterior" means "after"). P(A) is the prior probability of A <i>before</i> B happens ("prior" means "before").
